Discuss Inscition soil and solution soil with examples.

Insertion soil works by inserting the values in the existing sorted file. Il continues sorted array while interting single clement at a time. This process continues till away is sorted.

Selection sort perform sorting by searching for the maximum minimum value number and placing it into the first and it lost position according to the order (ousensking /descending). The process of searching the minimum key and placing it in the proper position is continued until the all the elements are placed at right position

Advantages

- · Insertion soit!
 - -> Early implemented, any very efficient when used with small data self - Best case complexity: O(n)

to be existed at

- Faster than other southing algorithms
- Live sorting technique
- Selection sort!
 - -> Easy (Simple implementation

 - useful when data get is less - Can be used when memby is less

Eramples:

	1
· Insection sort
